

Abstract of the Disclosure

A system for providing sequenced communications to members of a defined telecommunication group is provided. The system is accessible to a communicating user connected to a telecommunication network and includes an interface for providing the communicating user with the ability to initiate a sequence of separate communications to each of a plurality of members in the defined group, without the communicating user having to initiate separate communication sessions for each member. The system may permit communications to be made using one or more telecommunication modes such as telephone calls, instant messages, e-mail messages, or voice-mail messages.
